

Bird Bath Heater

DENK

Water Is Essential in Winter

Especially during cold winters, birds often struggle to find enough water. At this time of year, water for drinking and preening is just as important as it is during the hot summer.

Bird baths freeze easily due to their typically small volume of water and do not thaw well during the day. Other water sources on the ground are often contaminated by road salt or dirt, making them unusable for birds.

Our heated bird bath offers a solution. The heating is only necessary during the day when ambient temperatures are below zero degrees. It works without electricity and can be placed anywhere in the garden along with our bird bath.

Heating is simple, sustainable, and cost-effective using standard long-burning candles or grave candles. These burn for approximately 55 hours, allowing for heating on about 7 winter days (based on daytime operation). Operation costs only a few cents per day.

The birdbath heater is precisely designed to work with the Denk birdbath. It reliably keeps the water in the birdbath liquid down to an ambient temperature of -10°C .

Use on the floor or in the stand

The birdbath heater can be placed on the floor beneath the birdbath or used on a stand. In both applications, its design is tailored to form a harmonious unit with the birdbath.

Enclosed design is necessary

The enclosed design of the birdbath heater is necessary to prevent birds from being startled by any visible flame. Furthermore, this design keeps the heat directly beneath the birdbath, so that a small flame is sufficient for heating.

Year-Round Use

The birdbath heater can be used year-round with the birdbath, even without heating. In the summer, it complements the birdbath's appearance and raises its height. This gives birds a greater sense of security while drinking.

The Right Long-Lasting Candle

Only standard long-lasting candles measuring 9.5 cm in height and 6 cm in diameter may be used in the birdbath heater. These long-lasting candles are available at drugstores or home goods stores.

Larger or smaller long-burning candles, or regular candles, could either damage the bird bath or generate too little heat to keep the water in the bird bath liquid even in freezing temperatures.

Please note: We are not liable for damage to the bird bath or the bird bath heater caused by the use of candles that do not meet our specifications.

Installation

Place the long-burning candle in the center of the birdbath heater, over the designated drainage hole. Light the wick, then place the birdbath over it. Next, fill the birdbath with water. To extinguish the flame, remove the birdbath and blow out the long-burning candle.

Please note that if used directly on the ground, any water that seeps in may drain away. Do not place it in a low-lying area where water can pool. Otherwise, in freezing conditions, any ice that forms could damage the ceramic.

Cleaning

The birdbath heater, just like the birdbath itself, can be easily cleaned by hand with a brush and detergent.

Daily Water Change Recommended

Even in winter, it is recommended to change the water in the bird bath daily. This prevents dirt from accumulating on the ceramic and ensures that the birds always have fresh, clean, and germ-free water.
